

The ranges for light press are 0-99

The ranges for medium press are 100-599

The ranges for hard press are 600-1023

We have made two folders for FSR experiments that are the testing data and the training data.

In the training data, we have three folders that are the light press, medium press and the hard press containing 10,000 samples for each folder in csv files. We have also kept a folder of total training data in which the first 10,000 samples are of the light press, then from 10,001-20,000 samples are of the medium press and from 20,001-30,000 samples are of the hard press.

In the testing data, again we have three folders that are the light press, medium press and the hard press containing 10,000 samples for each folder in csv files. We have also kept a folder of total testing data in which the first 5,000 samples are of the light press, then from 5,001-10,000 samples are of the medium press and from 10,001-15,000 samples are of the hard press. By Again repeating the procedure, from 15,001-20,000 samples are of the light press, then from 20,001-25,000 samples are of the medium press and from 25,001-30,000 samples are of the hard press.
